Then execute it to make it work:

to add the perl directory to the path:

```
PATH=PATH:$HOME/perl
```

Edit .bash-profile and add the line

The file .bash-profile is a shell script executed at login.
The shell variable PATH is used to set the path.

envirnoment

directories must be executable to be penentratable

Example: chmod 644 file

me / my group / rest of the world
execute is 7
write is 2
read is 4

chmod 2001-10-14
